BUREAU OF OBSTETRICS.

D. C. McLaren, M. D., Chairman.

A MISCARRIAGE BETWEEN THE FOURTH AND FIFTH MONTHS.

Samuel A. Kimball, M. D., Boston, Mass.

This case illustrates the possibility of a continuous hemorrhage from the uterus, putrid in character from the products of decomposition, extending over a period of three months, without producing a miscarriage until between the fourth and fifth months.

A woman, unmarried, about thirty years of age, menstruated the first week in October, 1891.

She did not mensturate in November, but it was not unusual for her to be two or three weeks late.

She menstruated again the second week in December, so she informed me, and the flow continued, a bloody, excoriating, offensive discharge.

There was nausea, vomiting, faintness, craving for different articles of food; pain in the uterine region with soreness of the abdomen and epigastrium.
